PhishShift SRS

Decision support only - not a guarantee of safety.

PhishShift Message Risk Scanner SRS

1. Purpose: Provide a synthetic phishing-risk triage tool for helpdesk analysts without opening live URLs or using real data.

2. Scope: Includes synthetic corpus generation, cleaning, deduplication, campaign-grouped splits, rule + TF-IDF modeling, abstention logic, robustness checks, and a premium dark console UI.

3. Functional requirements: detect urgency, credential, portal, and defanged URL cues; compare models; maintain explainability; avoid live fetches.

4. Non-functional requirements: synthetic-only data, compliance-safe banner, no real PII, safe storage of defanged URLs, reproducible training pipeline.

5. Acceptance criteria: AT-01, AT-02, and AT-03 demonstrate legitimate low risk, suspicious phishing escalation, and stable perturbation behavior.
